

2023 Annual Drinking Water Quality Report

City of Livingston
PWSID#MT0000573

We're very pleased to provide you with this year's Annual Quality Water Report. We want to keep you informed about the excellent water and services we have delivered to you over the past year. Our goal is and always has been, to provide to you a safe and dependable supply of drinking water. Our water source is ground water. We have six wells located within the city. We have completed a source water protection plan that provides more information such as potential sources of contamination to our drinking water supply. This plan can be found online at <https://deq.mt.gov/water/Programs/dw#accordion1-collapse2>

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present include:

Microbial contaminants, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife;

Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming;

Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses;

Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems;

Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

We're pleased to report that our drinking water is safe and meets federal and state requirements.

If you have any questions about this report or concerning your water, please contact **Ryan Townsend**. He can be reached at **222-5667**. You may also attend our meetings. They are held on **the first and third Tuesday of each month at 414 E Callender St at 5:30 pm**.

Livingston chlorinates the water prior to entering the distribution system, and routinely monitors for constituents in your drinking water according to Federal and State laws. The following table shows the results of any detects in our monitoring for the period of **January 1st to December 31st, 2023**. For constituents that are not monitored yearly, we have reviewed our records back the last five years.

We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator that the drinking water has or has not met health standards. We will not conduct monitoring for asbestos because we have been granted a waiver by DEQ.

Also, we will not conduct monitoring for barium, cadmium, chromium, fluoride, mercury, and selenium, for five of our six wells because we have been granted a reduced monitoring waiver by DEQ. The exception is Well 8 D Street. This waiver is based on the analytical results for these chemicals and is valid until 2029.

We have monitored for lead and copper, and all our samples have been in compliance with the Lead and Copper Rule. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Livingston is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Parameter	Date	90th % value	Units	Action level	Source of Contamination
Lead	2021	2	ppb	15	Household plumbing
Copper	2021	0.325	ppm	1.3	Household plumbing

In the tables above and below you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Parts per billion (ppb) or Micrograms per liter (ug/l) - one part per billion corresponds to one minute in 2000 years or a single penny in \$10,000,000.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Action Level - the concentration of a contaminant which if exceeded, triggers treatment or other requirements which a water system must follow.

Treatment Technique (TT) - (mandatory language) a treatment technique is a required process intended to reduce the level of a contaminant in drinking water.

Maximum Contaminant Level - (mandatory language) The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal - (mandatory language) The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some constituents have been detected. The EPA has determined that your water **IS SAFE** at these levels.

While your drinking water meets EPA's standard for arsenic, it does contain low levels of arsenic. EPA's standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. EPA continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

MCL's are set at very stringent levels. To understand the possible health effects described for many regulated constituents, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

TEST RESULTS								
Contaminant	Violation Y/N	Sample Date	Highest Level Detected	Range	Unit Measurement	MCLG	MCL	Likely Source of Contamination
Inorganic Contaminants								
Fluoride	N	2022	0.7	0.5 - 0.7	ppm	4	4	Erosion of natural deposits
Nitrate + Nitrite as N	N	2022	1.56	0.91 - 1.56	ppm	10	10	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
Barium	N	2022	0.07	0.05 - 0.07	ppm	2	2	Erosion of natural deposits
Arsenic	N	2022	7	1-7	ppb	0	10	Erosion of natural deposits
Radioactive Contaminants								
Uranium	N	2023	1.5	0.9 - 1.5	ppb	0	30	Erosion of natural deposits
Disinfection By-products								
Chlorine	N	2023	0.50	0.20 - 0.50	ppm	MRDLG 4	MRDL 4	Water additive used to control microbes
Total Trihalomethanes (TTHMs)	N	2023	3.5	3.5 - 3.5	ppb	0	80	By product of drinking water chlorination
Haloacetic Acids (HAAs)	N	2023	1.2	1.2 - 1.2	ppb	0	60	By product of drinking water chlorination

Special Notice for Uncorrected Significant Deficiencies

In August 2023, this public water system has received notice from the state of a significant deficiency related to the City Pool that had not been corrected before December 31, 2023. Specifically:

The supply line to the municipal pool allowed for a possible cross connection from our municipal pool to the city water distribution system, The City was required to install approved backflow protection on the line filling the pool before May 2024.

In October of 2023, the city's proposed corrective action schedule to the state given specific consideration of the advanced age of the pool, and it would likely no longer be in service in 2-3 years. The city considered the following measures:

1. Elimination of the cross-connection between our municipal pool and the city water distribution system, scheduled for March 2024.
2. Implementation of an air gap or replacement of the discharge above the high-water level of the pool.

In October 2023, the state extended the corrective action plan and accepted the proposed plan. On November 30, 2023, the City of Livingston notified the state of its intention to proceed with the backflow mitigation measure of an air gap in the municipal pool. The work was set to commence in

January 2024, subject to weather conditions, with completion expected by April 1, 2024. This plan was accepted by the state.

In April of 2024, the city notified the state, the work had been completed.

On April 9, 2024, the City received notification from MT DEQ confirming compliance with the significant deficiency and closure of the scheduled actions.
